Kuku FM | Find the Promos

Problem 1 — screenplay-based promo discovery | Prototype solution

Objective: identify 20–60 second continuous screenplay segments with a compelling hook in the first 3 seconds, a meaningful unresolved ending, standalone clarity and coherent emotional stakes.

Approach

1. Parse: Deterministically parse all 50 episode TXT screenplays into scene/event records while preserving original timecodes, overlapping tracks and boundary exceptions.

2. Generate: Create 162 time-bounded candidates across all 50 episodes. Preserve complete contained events; separate boundary-crossing material and post-cut lookahead.

3. Evaluate: Score each candidate with a fixed rubric: Hook 25%, Cliffhanger 25%, Clarity 25%, Emotion 15%, Coherence 10%. Mandatory gates reject weak hook, weak cliffhanger, insufficient clarity, incoherence or unusable cut boundaries. Claude was used manually in 17 batches; no API dependency.

4. Rank and curate: Python validates schema and candidate IDs, recomputes weighted scores, filters gate failures, ranks eligible clips, and flags overlapping/repetitive moments. An editor-facing shortlist is created with exact screenplay timestamps.

Results

50 episodes → **162 candidates** → **80 eligible** → **Top 20 ranked** → **10 diversified showcase picks.** All 162 candidate evaluations passed structural checks. The ranking is screenplay-based; clips have **not** been checked against finished video.

Representative showcase picks

ID	Episode / time	Score	Promo hook / ending
C026-03	E26 00:56.00–01:55.50	4.50	Duchess grips Juliana: hidden strength
C030-03	E30 01:34.60–02:16.20	4.50	Catherine reveals malicious intent
C012-03	E12 00:57.30–01:27.21	4.50	Juliana accepts dangerous garden challenge
C013-02	E13 00:47.20–01:28.80	4.50	Juliana trapped in frozen briars
C043-04	E43 01:09.00–01:42.20	4.42	Death deception confronted
C032-04	E32 01:41.00–02:31.20	4.38	Branding-rod attack imminent

Prototype, validation & handoff

Runnable workflow

The ZIP contains **build_phase4.py** plus the complete **kuku_phase4/inputs/** and output files. From the extracted **kuku_phase4/** folder, run **python build_phase4.py** (requires Python and standard-library modules; see README). It recreates ranking exports from original candidate and batch evaluation data.

Editor checklist

For each proposed promo, verify: (i) first three seconds contain a genuine hook; (ii) last shot ends before a consequential payoff, not mid-word; (iii) names, dialogue and actions match footage; (iv) timestamps align to the finished video timeline; (v) subtitles, sound, transitions and platform compliance; (vi) repeated story beats are not overrepresented.

Known limitations and safeguards

Screenplay timecodes are not verified edit decision lists; parallel camera/action/dialogue tracks can overlap. LLM assessments are subjective and may overrate emotional endings. The Top 20 has no pair exceeding the 50% overlap threshold, but thematic repetition remains. Candidate C015-01 contains cliffhanger evidence at 01:00–01:01 although its window ends 00:47.30; this is flagged for manual audit and excluded from the 10-showcase set.

Deliverables in ZIP

Raw outputs: all_ranked_candidates.csv (162), eligible_pass_candidates.csv (80), top20_diversified.csv (20), top20_editor_review.json, showcase_top10.csv (10), top20_editorial_review.csv, phase4_summary.json. **Reproducibility:** full input archives, all 17 batch responses, Python ranking script, README.

Editorial selection logic

The 10-showcase set prioritizes high weighted scores while diversifying episode and story beat. Episode 36, for example, contributes one principal showcase rather than three similar clips. The remaining Top 20 are preserved as alternates. No claim of production-ready video exports is made.

Next production step

Upload the final episode video assets, verify candidate start/end timecodes against footage, refine cuts where needed, and obtain editor approval before using clips in paid promotions.

Status: Working screenplay-based prototype and submission-ready analysis package; external GitHub/Colab hosting and video verification remain outstanding.
